Titel:

The threat to power supply

Autor:

Dr. Arndt von Schemde, PhD & Svend Boye

Abstract:

The report provides an overview of the threat landscape facing Norwegian power supply in the short and long term. Power supply must expect to be exposed to intelligence gathering, attempts at economic positioning, influence operations, and possibly sabotage, both in the form of cyber attacks and attacks on physical infrastructure. In a war, the power supply will be a priority target. Russia has developed a comprehensive collection of methods and tools below the level of direct military force, including the use of actors such as hacker groups and criminals, while continuing to develop its military attack capabilities. China seeks control over supply chains, recruits Norwegian citizens to gain access to sensitive and classified information, and uses actors with no official connection to the country as tools for intelligence and cyber attacks.
